

ILLUSTRATIVE SAMPLE / ASSESSMENT ONLY

Website Health Check

Example Bakery • \$375 CAD assessment

Example Bakery, the example.com URLs, observations, and schematic are fictional. No live website was audited for this sample. A customer report records the actual review date, URLs, screenshots or other evidence, browser versions, screen sizes, and access limitations.

01 / Current-state findings

Example Bakery has a usable public site, with two medium-priority improvements and one low-priority broken link in this fictional example. No production changes have been made. These three findings demonstrate the format; they are not a promised finding count.

02 / Evidence & verification

F01 / Medium - Domain versions take inconsistent paths

Illustrative URL: <https://www.example.com/>

Illustrative response-chain record: the www address passes through an extra redirect before the preferred HTTPS address. This is a hypothetical observation, not a measured response.

Impact: Different entry paths can make the preferred address less clear and complicate maintenance.

F02 / Medium - Mobile contact action is hard to find

Illustrative URL: <https://example.com/>

Illustrative narrow-screen layout: the contact action sits below several lower-priority content blocks. The schematic demonstrates how a screenshot could support a real finding.

Impact: Visitors may need unnecessary scrolling before they can contact the business.

F03 / Low - Footer contact link uses an old path

Illustrative URL: <https://example.com/contact-old/>

Illustrative link record: the footer points to an obsolete contact URL that returns a not-found page in this fictional scenario. The main contact navigation still works.

Impact: A secondary contact route leads to a dead end.

RECOMMENDATIONS / NO CHANGES MADE

03 / Prioritized fix plan

Address the two medium-priority improvements, then the low-priority footer link. No Critical or High finding is implied.

F01 / Medium - Domain versions take inconsistent paths

Confirm the preferred public address, then have the site operator scope a consistent redirect.

Acceptance check: Recheck HTTP, HTTPS, www, and non-www entry points and record each final address.

F02 / Medium - Mobile contact action is hard to find

Move or repeat the contact action near the mobile introduction.

Acceptance check: Recheck the contact path at the recorded mobile screen size after a separately approved change.

F03 / Low - Footer contact link uses an old path

Replace the footer destination with the current contact page.

Acceptance check: Follow the footer link from the agreed pages and record the destination and result.

F02 / Illustrative evidence schematic

Contact action appears late

Fictional layout, not a captured website.

A real finding includes captured evidence.

COVERAGE / OWNERSHIP / NEXT STEPS

04 / Browser verification

A paid report records the actual review date, page URLs, browser versions, screen sizes, checks completed, and checks not completed. This fictional sample has no actual test environment.

CHECK	STATUS / BOUNDARY
Public home and contact paths	Illustrative review Desktop and mobile layouts represented; no real browser run.
Domain entry points and footer links	Illustrative review Hypothetical response and link records F01 and F03.
Form delivery / booking / checkout	Not verified No submission or transaction performed.
Analytics, CMS, and backup recovery	Not verified No account access supplied; no restore test performed.

05 / Handoff notes

The owner or chosen developer can use F01-F03 to scope the next work. Confirm the preferred domain and current contact destination before implementation. Keep the original evidence with the report and record any later verification separately. Purchasing further work from Andreacchi Digital is optional.

Assessment scope

The \$375 CAD Health Check includes assessment, evidence, and recommendations. Remediation and implementation are quoted separately when required.

No production repairs, backup creation, penetration testing, or guarantee that every hidden defect will be found. Checks requiring unavailable access are marked Not verified.

Use this report with your preferred provider.
